

ABSTRACT OF THE DISCLOSURE

An information processing apparatus allows a user to obtain copies printed in a plurality of desired formats by performing a setting operation only once without having to further perform a complicated operation. Property information specifying the manner in which data is to be printed is set via setting means. Thereafter, if a special printing mode is not specified by special-printing-mode specifying means, first print property information describing the manner in which data is to be printed on a first recording sheet is generated by print property information generating means in accordance with the property information set by the setting means. However, if the special printing mode is specified, in addition to the first print property information, second print property information describing the manner in which data is to be printed on a second recording sheet is generated by the print property information generating means.
